

BIOS 611 PROJECT 1

OCT 7TH, 2019

BY WONKYUNG JANG

Background & Data source

The Urban Ministries of Durham (UMD) Project aims for connecting with the community to diminish homelessness and fighting poverty through providing food, shelter and a future to neighbors with special needs (UMD, 2019).

The dataset is offered by the Urban Ministries of Durham (UMD) Project Team (<http://www.umdurham.org/>), which includes the dataset with 79838 observations from 1990's to 2019.

URBAN MINISTRIES
OF DURHAM

Variables

1. Client File Number (Identifier)
2. Bus Tickets: Service discontinued
3. Food: # of people in the family for which food was provided
4. Food Pounds: # of pounds of food that each individual or family received when shopping the food pantry
5. Clothing Items: # of clothing items that each individual or family received in the clothing closet
6. Diapers: # of packs of diapers received (individuals/families are given 2 packs of diapers per child, and packs contain 22 diapers on average)
7. School Kits
8. Hygiene Kits: # of kits received per individual or family. Kits contain soap, shampoo, conditioner, lotion, deodorant, a toothbrush, toothpaste, a washcloth, a disposable razor, and a bottle of shaving cream.
9. Financial Support: Service discontinued

Rename the variables

```
data <- rawdata %>%  
  rename(ClientID = Client.File.Number, Bus = Bus.Tickets..Number.of., Note = Notes.of.Service,  
         Food = Food.Provided.for, Clothing = Clothing.Items) %>%  
  select(Date, ClientID, Bus, Food, Food.Pounds, Clothing, Diapers, School.Kits, Hygiene.Kits,  
         Referrals, Note, Financial.Support)
```

Filtering

```
data$Date <- as.Date(data$Date, format = "%m/%d/%Y")  
data = data %>%  
  filter(Date >= "1983-01-01" & Date <= "2019-10-01")
```

Given that the UMD was established in 1983, we should remove some rows with dates before 1983 or after 2019. Here, the Date data was converted into DATE format.

Outliers

Trimming: detect, visualize and test for outliers

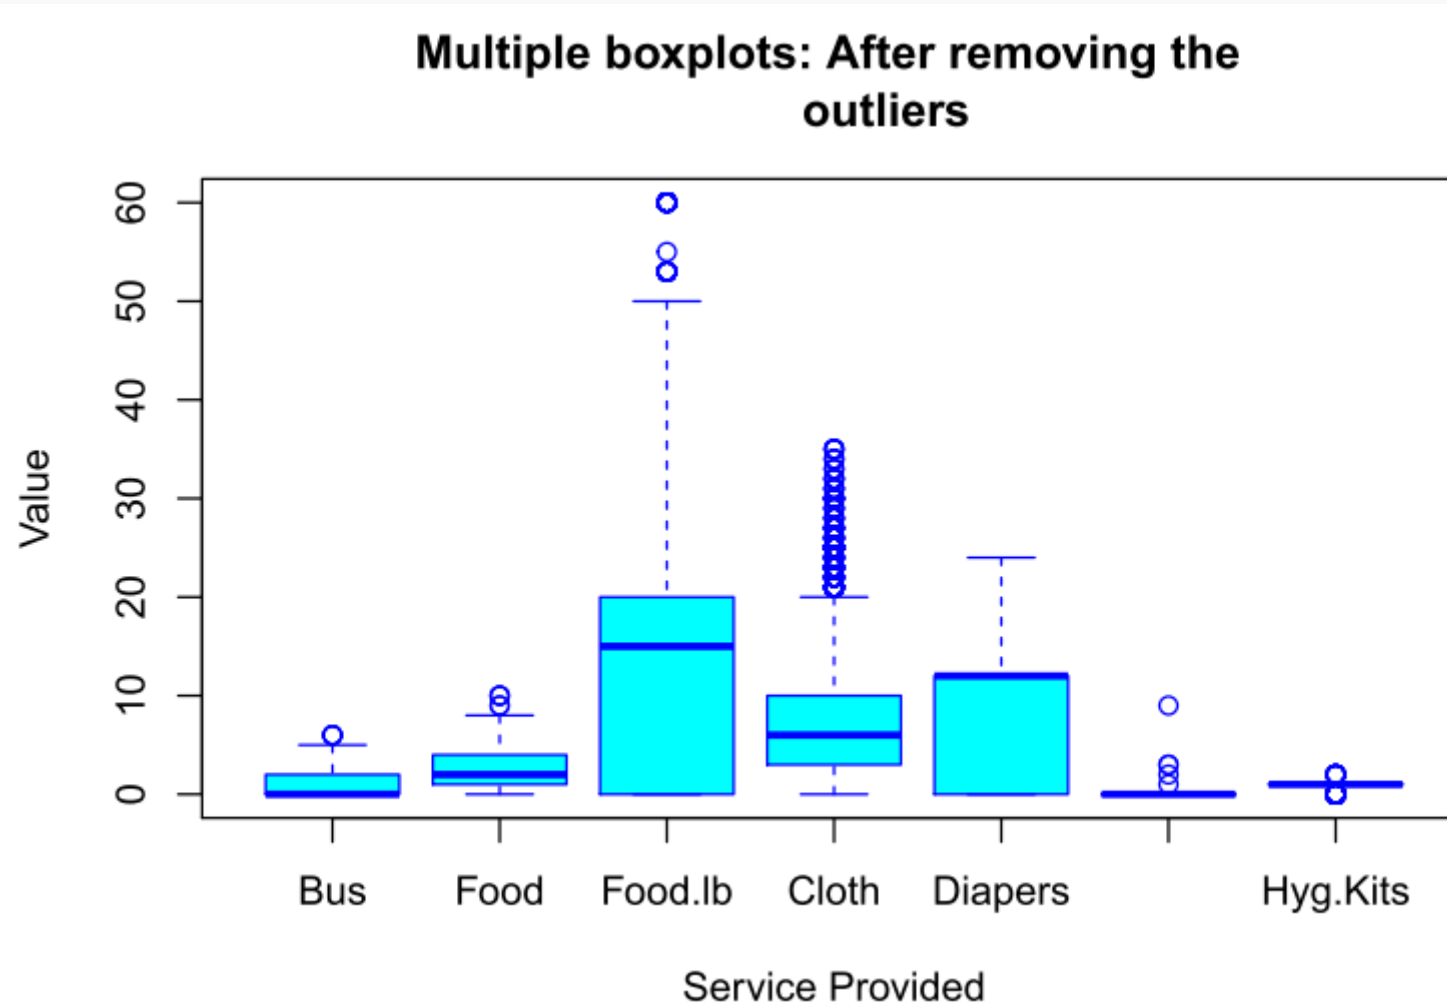

Rosner test

$$R_{i+1} = \frac{|x^{(i)} - \bar{x}^{(i)}|}{s^{(i)}}$$

```
rosnerTest(data$Bus, k = 10, warn = F)
```

```
## Alternative Hypothesis:      Up to 10 observations are not
##                               from the same Distribution.
##
## Type I Error:                5%
##
## Number of Outliers Detected:  6
##
##      i   Mean.i      SD.i Value Obs.Num   R.i+1 lambda.i+1 Outlier

## 10 9  1.128514  1.436685     6     19  3.390783   3.670208   FALSE
```

Rosner test

Number of Clients by Year and Month & Duration of Assistance

Number of Clients by Year

```
client.data = data %>%
  select(Date, ClientID) %>%
  drop_na() %>%
  separate(Date, sep = "-", into = c("Year", "Month", "Day"))
ggplot(data = client.data) +
  geom_bar(mapping = aes(x = Year, fill = Year)) +
  labs(title = "Number of Clients by Year") +
  theme(legend.position = "none")
```

Number of New Clients by Year

```
client.data = data %>%  
  select(Date, ClientID) %>%  
  drop_na() %>%  
  separate(Date, sep = "-", into = c("Year", "Month", "Day")) %>%  
  distinct(ClientID, .keep_all = TRUE)  
ggplot(data = client.data) +  
  geom_bar(mapping = aes(x = Year, fill = Year)) +  
  labs(title = "Number of New Clients by Year") +  
  theme(legend.position = "none")
```

Number of Clients by Month

Month

Number of New Clients by Month

Month

Client's Duration of Assistance

```
client.data.duration <- data %>%  
  group_by(ClientID) %>%  
  summarize(Duration = difftime(max(Date),min(Date))) %>%  
  filter(Duration > 0 & Duration < 10000)  
ggplot(data = client.data.duration) +  
  geom_histogram(mapping = aes(x = Duration, fill = Duration), binwidth = 300) +  
  labs(title = "Client's Duration of Assistance")
```

Seasonality

2000-2010

Food Sum by Year

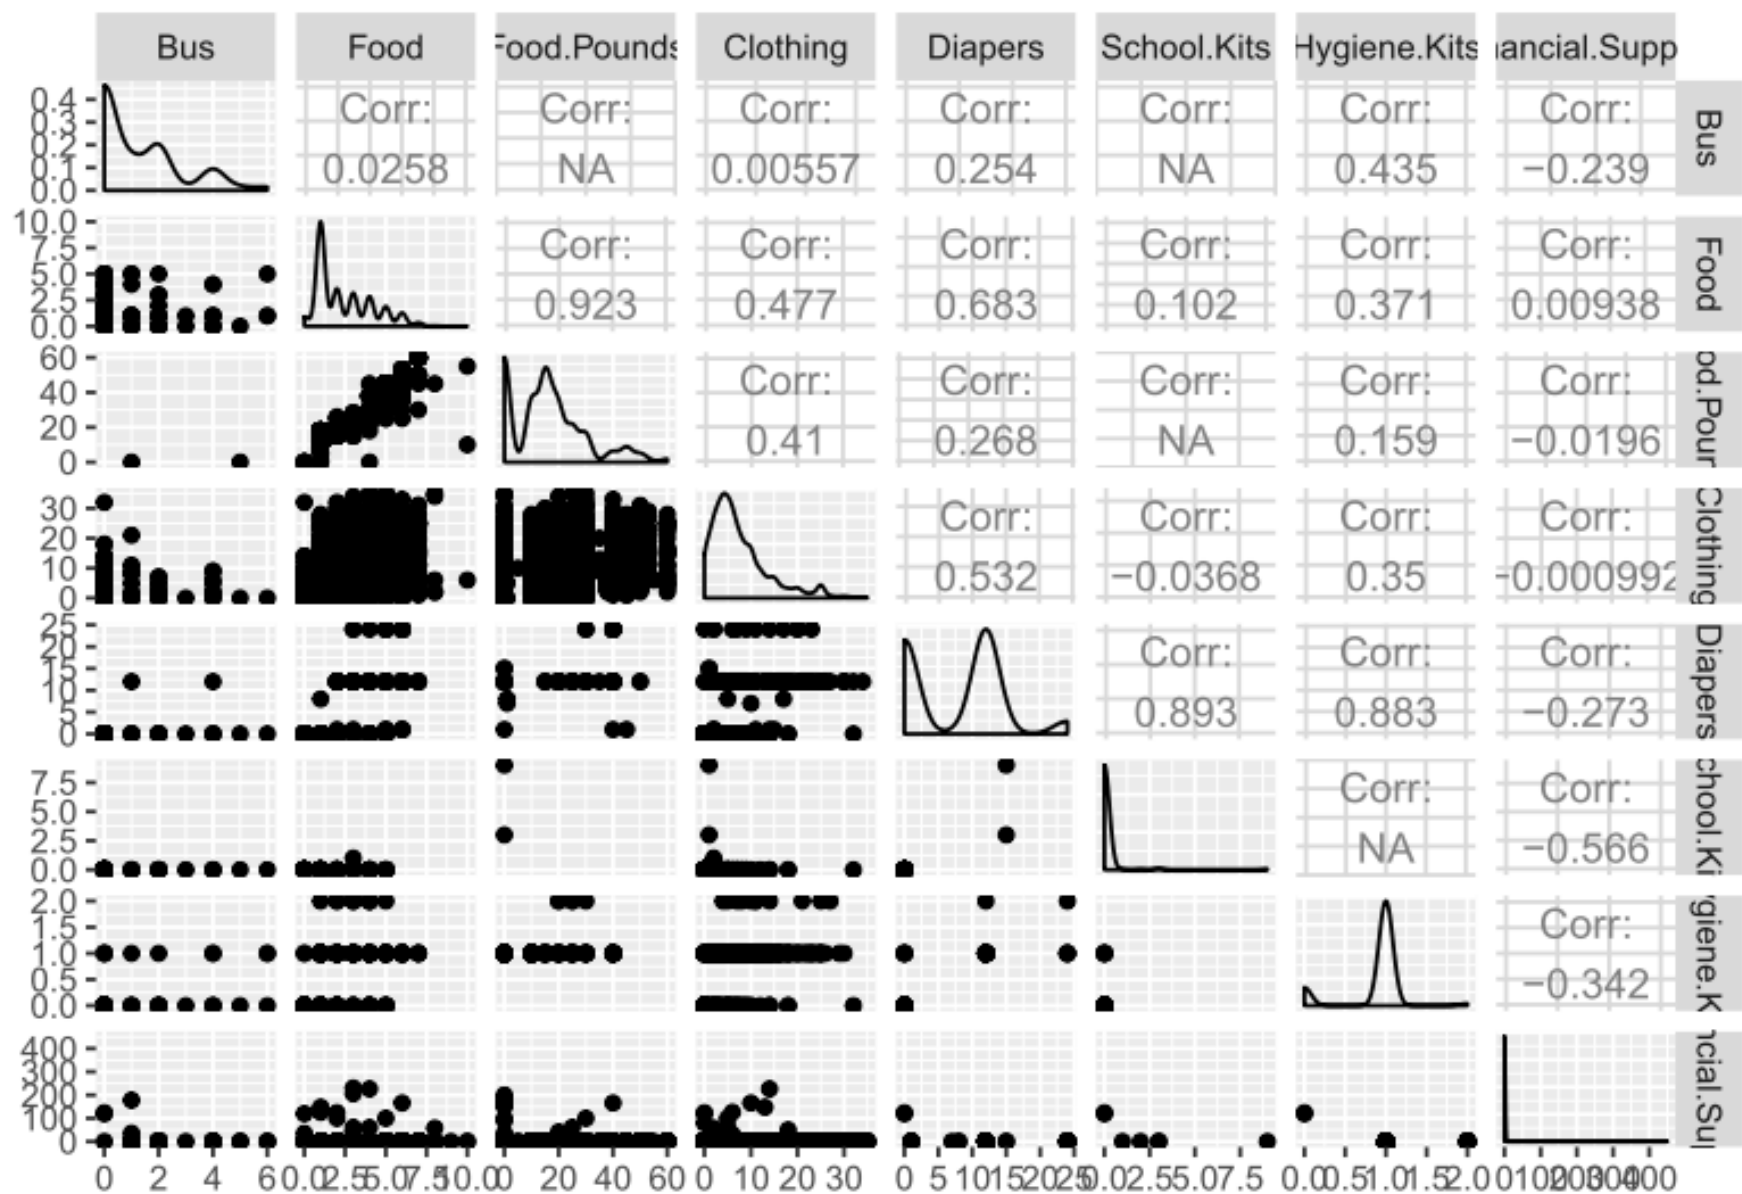

```
food.data = data %>%  
  select(Date, Food) %>%  
  filter(Date >= "2000-01-01" & Date <= "2010-10-01") %>%  
  drop_na() %>%  
  separate(Date, sep = "-", into = c("Year", "Month", "Day")) %>%  
  group_by(Year, Month) %>%  
  summarise(sum = sum(Food))  
ggplot(food.data, aes(x = Month, y = sum, group = Year)) +  
  geom_area(aes(fill = Year), position = "stack")
```

2011-2019

Food Sum by Year

Conclusion

1. The number of new clients served by UMD had been increasing until 2002 but has been decreasing up to now.
2. The number of clients served by UMD each month do differ. Generally, March is the month when the UMD serves the least amount of clients, and July is the month when the UMD serves the most amount of clients between 1994 and 2019.
3. The histogram of the duration of assistance was skewed right with a tail going off to the right. The most amount of clients was served by the UMD for 0-500 days and there are people who have been served over 10-20 years.
4. Fourth, between 2000 to 2010, sum of the amount of foods tended to peak for July and then decline after summer. So time series of the food amount typically showed increasing pattern from January through July and declining pattern from July to December.
5. On the other hand, between 2011 to 2019, Sum of the amount of foods tend to peak for May and June, then decline after summer and rise again during winter. So time series of the food amount typically show increasing pattern from February through May , declining pattern from July to september and increasing pattern again from September to January.
6. Lastly, there is statistically significant relationship between 1) Clothing and Food, 2) Diapers and Food, 3) Hygiene.Kits and Bus, 4) Hygiene.Kits and Food, 5) Hygiene.Kits and Diapers, and 6) Clothing and Food.pounds.

thank you!
